IDEATION PHASE: PROBLEM STATEMENT ANALYSIS

The Challenge of Digital Accessibility for Local Booksellers

Traditional, independent booksellers often operate with thin margins and struggle to establish an online presence. Creating a customized e-commerce web platform requires software engineering skills, host configuration knowledge, and high development costs. Consequently, small local retailers remain locked out of the digital economy.

User Friction & Cart Abandonment for Readers

For readers, purchasing books online often involves navigating cluttered interfaces filled with irrelevant items and dealing with multi-step checkout processes. This leads to high cart abandonment rates. Additionally, customers lack direct ways to buy books from verified independent sellers securely.

Proposed Solution: BookVerse

The BookStore (BookVerse) application addresses these issues by offering a streamlined, lightweight, role-based platform. By providing approved sellers with dedicated dashboards for catalog uploads and order status tracking, and customers with a simplified "Buy Now" instant checkout flow, the platform creates an efficient and accessible online ecosystem.
